ABSTRACT

The present invention is to provide a polymerizable compound which can be a raw material for a resin having high transparency, good heat resistance and mechanical strength required for optical components such as plastic lenses and the like, while attaining a high refractive index (nd) exceeding 1.7, and an optical component composed of such a resin.

10 Disclosed is a compound represented by the general formula (3),

$$\left[\begin{array}{c|c} & & & \\ & & & \\ & & & \\ \end{array}\right]_{p}^{M-\left(\Upsilon_{q}\right)_{n-p}}$$
(3)

wherein, in the formula, M represents a metal atom; X_1 and X_2 each independently represent a sulfur atom or an oxygen atom; R_1 represents a divalent organic group; m represents an integer of 0 or 1 or more; p represents an integer of from 1 to n; q represents an integer of from 1 to (n-p); n represents a valence of a metal atom M; Yq each independently represent an inorganic or organic residue; and when q is 2 or more, Yq may be bonded to one another for forming a ring structure with the intermediary of a metal atom M.
